

EE 193 Homework 1

Reflection

Now that you've assembled and started testing your temperature sensor breakout board, take a few minutes to reflect on the process.

- What about your design worked well?
- What would you improve or change if you were to redesign the breakout board from scratch?
- What is something you've learned through this process? How might you use this knowledge or experience in the future?

Write your answers in a document and upload it to the `project1_pcb` folder on the class Google Drive. You should have at least 4-5 sentences for each question.
